A.F.S. PROCESS

Atoric Front Surface (A.F.S.) freeform combined with the back surface freeform creates a lens with minimum distortion.

Limitation of Back Side Technology

- 1 = width of far zone
- 2 = width of near zone
- 3 = width of intermediate zone
- 4 = degree of side distortions

Although Back Side PALs gains improvement over Conventional PALs:

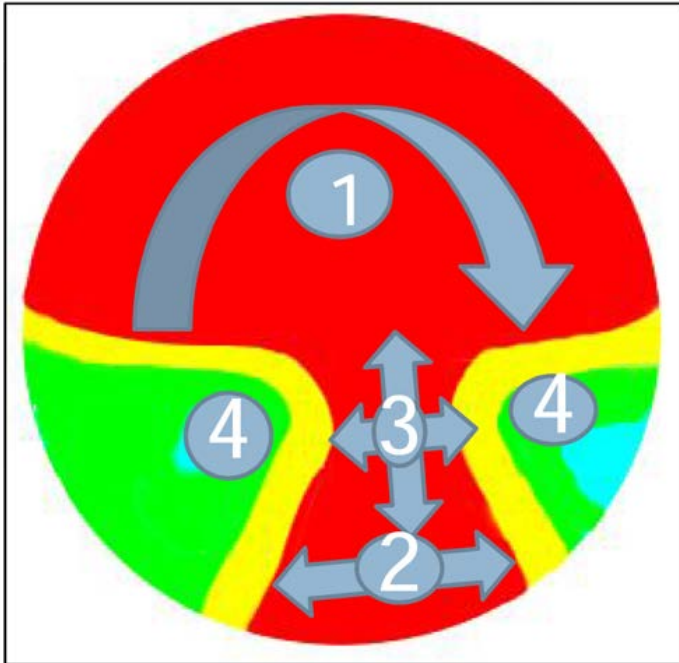

- Widen usable zones up to 20-30%
- Reduce side distortions 20-30%

Optimization still under limitation of certain value of $1 + 2 + 3 + 4$

There is a trade off between 4 parameters

- increase 1: decrease 2 – 3(x-axis), increase 4
- increase 2: decrease 1 – 3(x-axis), increase 4
- increase 3(x-axis): decrease 1 – 2, increase 4
- decrease 4: decrease 1 – 2 – 3(x-axis), increase 3(y-axis).

Re-design new optimization for back side PALs

1 = width of far zone
2 = width of near zone
3 = width of intermediate zone
4 = degree of side distortions

Re-designed & Re-optimized BS PALs,
objective :

- to widen 1 Far zone 30% more
- to widen 2 Near zone 30% more
- to widen 3 Mid zone 30% more
- to reduce side distortions 30% less

**New optimization by using Multiple of
Front Free Form to the Back side Free Form**

New Front Free Form surface create new
Optimization where as:

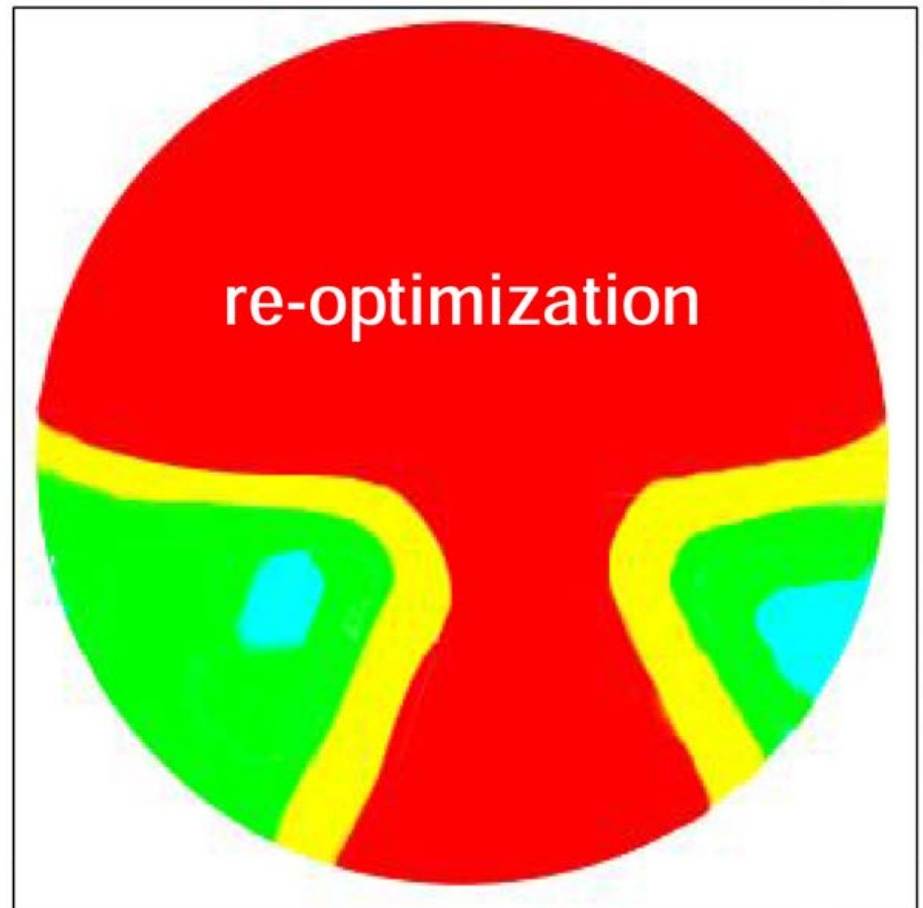

- increase 1: by 30%
- increase 2: by 30%
- increase 3: (x – axis) 30%, (y-axis remain same)
- decrease 4: 30%

Concept of Front Freeform surface design

With a new Front Freeform surface

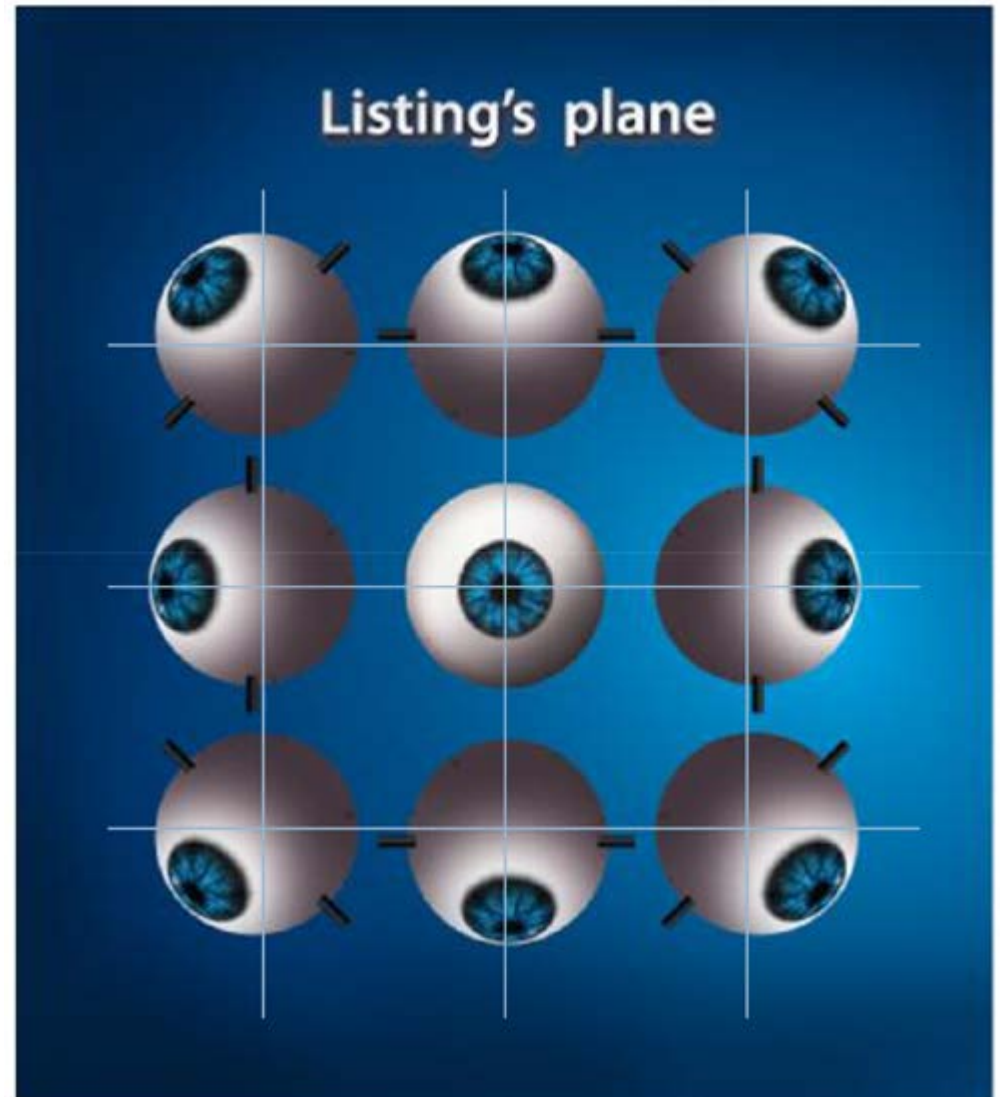

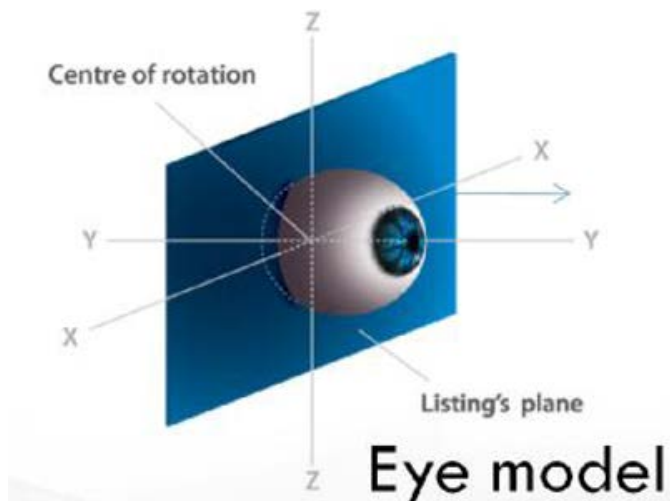

A Re-optimized Back side PALs.

Find an appropriated model of Front FF

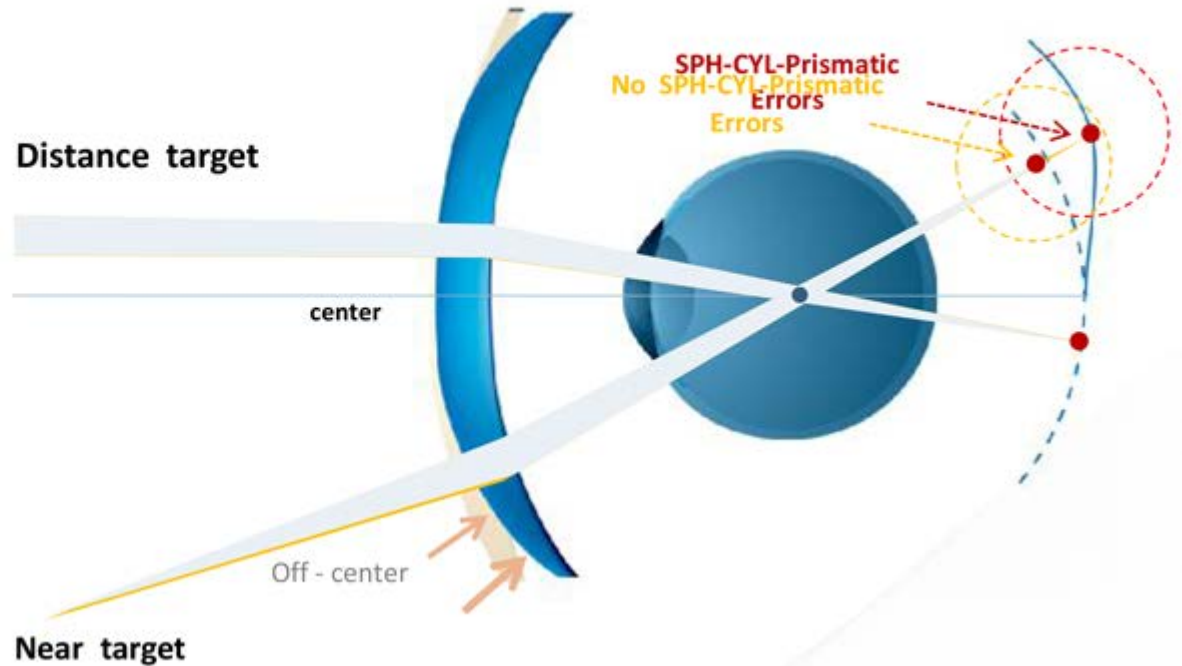

Concept of Front Freeform surface design

New front Freeform surface must help reducing oblique aberrations created from eye rotation model over all view zones.

Oblique aberrations - Optimisation

Side View

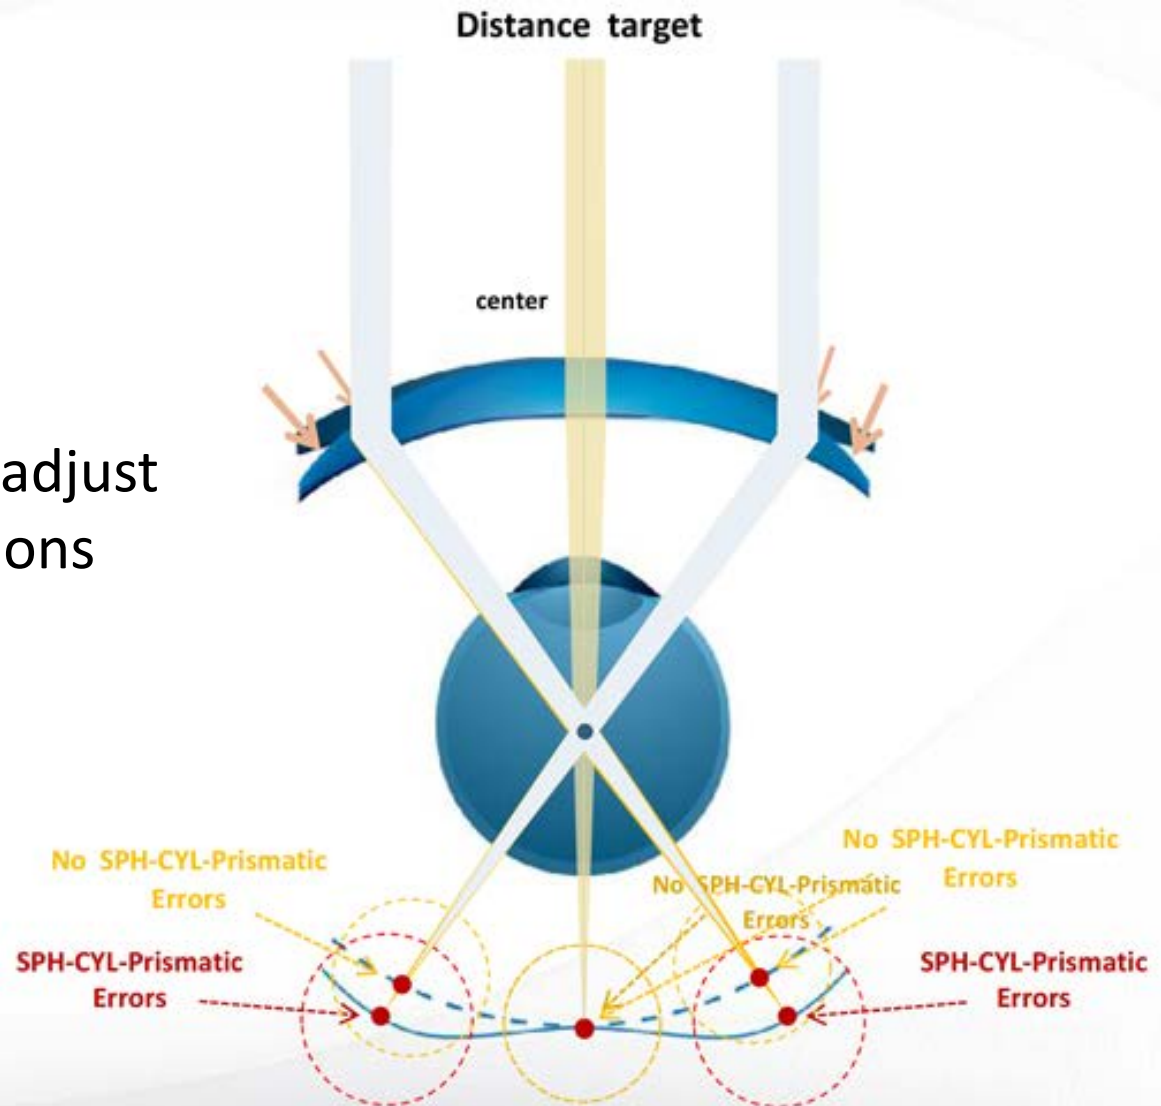

Solution : curve design adjust
to suit eye model rotations

Oblique aberrations - Optimisation

Top View

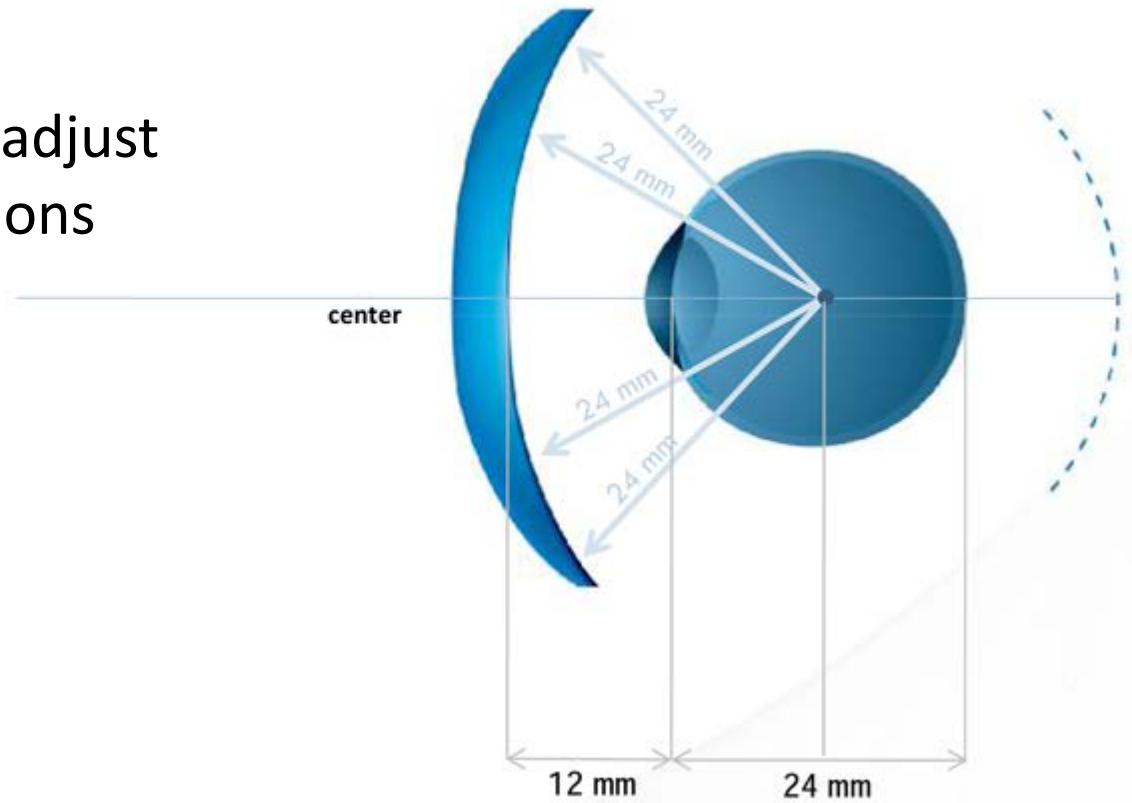

Solution : curve design adjust
to suit eye model rotations

Oblique aberrations - Optimisation

Side View

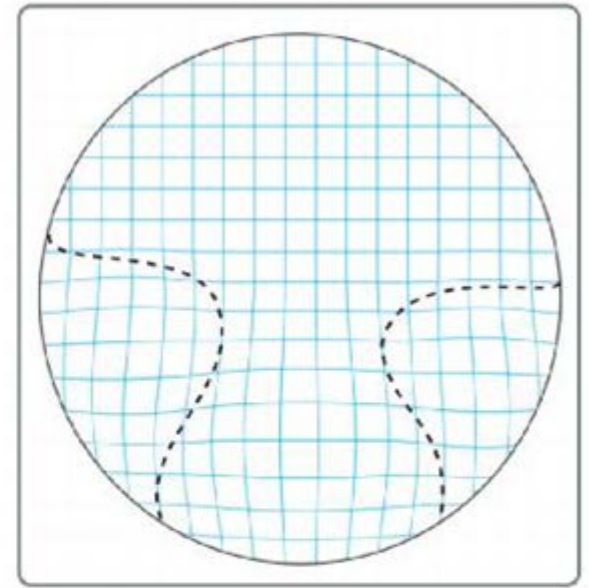

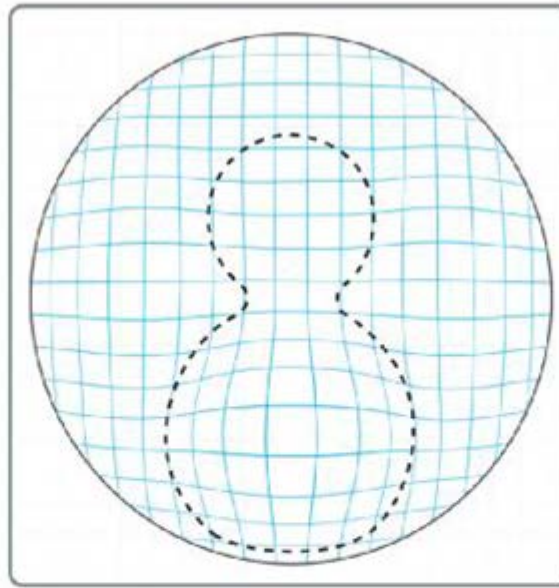

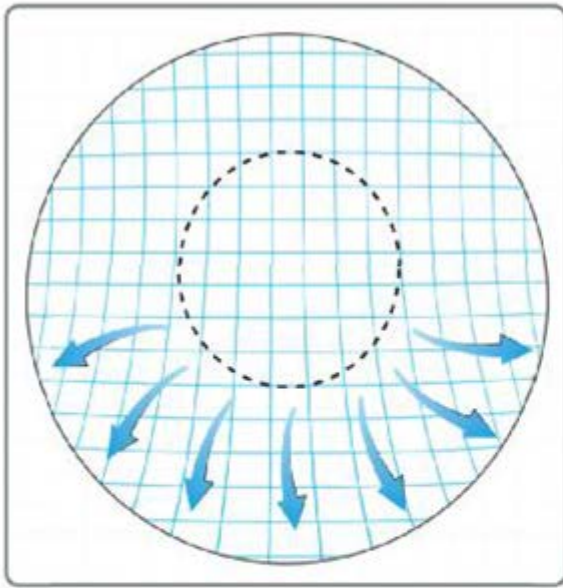

Solution : curve design adjust
to suit eye model rotations

A consideration of human eye dimensions

Final Result

Concept of Re-designed A.F.S.

Multiple Freeform digital surfaces PALs

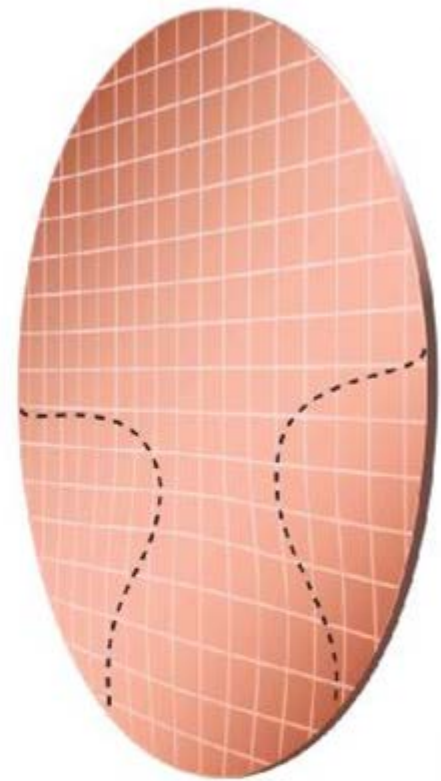

Front Surface :
Atoric Progression

Back Surface :
Soft Progressive

=

Result : PALs
Targeted :
Zones widen 30%
Distortions down 30%

Result from the test wear: Near Zone

9 wearers out of 10, felt significant improvement

1 wearer, felt some improvement

0 wearer, felt no improvement

Conventional FF backside

A.F.S.

Near Vision Zone

Result from the test wear: Mid Zone

8 wearers out of 10, felt significant improvement

2 wearers, felt significant improvement (after 2 days trial)

0 wearer, felt no improvement

Conventional FF backside

A.F.S.

Mid Vision Zone

Result from the test wear: Improvement of side distortions

Conventional FF backside

Improvement of distortions: Far Vision Zone

Result from the test wear: Improvement of side distortions

A.F.S.

Improvement of distortions: Far Vision Zone
